

I am a 10 year old that is home schooled in Dexter, MI. I like math, science, Legos and dogs. We try to go on a fieldtrip every Friday and I go to a home school co-op on Tuesdays. Dexter is a small rural community a 15 minute drive to Ann Arbor.

My first hypothesis was: All samples in the US are going to be about the same water usage per day. This was a false hypothesis because I found out by my graph that each state varies in water usage per day.

My second hypothesis was: In Bangladesh people will use less water than the US. This hypothesis was correct.

My final hypothesis was: The people in Spain will use more water than the US. This hypothesis was false.
