## Our Hypothesis

We think that the macro-invertebrates in our pond, Fairyland, are not the same as the other macro-invertebrate around the world. The ponds around the world will probably have a different temperature and ph. Also, though the species might have been the same at one point, they would have adapted to the current conditions of the pond and changed.

## What We Thought

We had a lot more other macro-invertebrate, like a beetle, than we assumed before. The number of damselflies also surprised us. There were a lot more than expected. The number of snails shocked us. It showed that our pond might be more polluted than we thought before.
