

Grover Hill Elementary School, Grover Hill, OH

Hypothesis:

Our class predicted that we would find more of the following organisms: snails, mosquito larvae, dragonfly nymphs and mayfly nymphs in the drainage ditch than in each creek.

We are two sixth grade classes at Grover Hill Elementary School in Grover Hill, OH. This was the first year completing these investigations of water samples. Our teacher, Miss Sinn, brought us water samples from a drainage ditch and two creeks. We love hands on Science projects especially when we can get "dirty"!!!

We used our new open view buckets to view the water samples which were brought in. We used our sample identification cards and technology to assist in our identification of the organisms.

We found the following:

Organisms	Drainage ditch	Creek near school	Creek near Miss Sinn's house
Snails	5	2	3
Mosquito larvae	4	3	4
Dragonfly nymphs	3	1	3
Mayfly nymphs	6	2	1
